- The author has no relevant financial relationships with the manufacture(s) of any commercial product(s) and/or provider(s) of commercial services discussed in this activity

National Burn Service - Regional Burn Units

Who, Where & How

- Very young (& very old)
 - ~50-60% are scalds, predominately in the kitchen or bathroom
 - ALWAYS beware non-accidental injury
- Adults
 - ~50% from explosions & flame
 - ~33% from scalds
 - ~50% are at home, ~15-20% at work

Burn Injury

- Function of...
 - contact time
 - temperature
 - external protection (ie clothing)
 - area of contact (thickness of skin)
 - age of patient (very young & old with thin skin)
 - *mechanism of burn*
 - thermal, chemical, electrical

Systemic Effects of a Major Burn

- Depends upon... TBSA
Patient's age
& Patient's reserves
- <20% → usually no major effects
- Larger burns result in:
 - Hypovolaemia from fluid shifts
 - Immunosuppression
 - Gastric stasis

ATLS / EMST / EMSB Basics

- Primary Survey

- A = airway with C-spine control
- B = breathing & ventilation
 - always supply supplemental O₂
 - carbon monoxide poisoning may give cherry-pink colour despite patient being 'hypoxic'
 - half-life of CO in room air is 4–5 hours, down to 45 minutes with O₂
 - evaluate possibility of INHALATIONAL INJURY

C = circulation with haemorrhage control

- burns do not cause hypotension
- occult injuries will be responsible for hypotension

INHALATIONAL INJURY

- Doubles the mortality rate
- Important determinant of survival from burn
- Suspect if *history* of...
 - trapped in confined space with fire
- Suspect if *find*...
 - burns or singeing to mouth, nose, pharynx
 - carbonaceous sputum
 - stridor, change in voice

Burn Wound Assessment

Size of Burn (TBSA)

- Lund & Browder Chart

LUND & BROWDER BURNS CHART - ADULT

Front view percentages: Head (A) 1, Neck 1, Ant. Trunk 13, Post. Trunk 1, Right Arm 2, Left Arm 2, Right Leg 1½, Left Leg 1½, Buttocks 1, Genitalia 1.

Back view percentages: Head (A) 1, Neck 1, Ant. Trunk 13, Post. Trunk 2½, Right Arm 2, Left Arm 2, Right Leg 1½, Left Leg 1½, Buttocks 2½, Genitalia 1.

C=½ of one leg	2%	2%	2%	3	3%	3%	

Date: _____

Burn Depth Assessment

- Easy to assess extremes
 - superficial burns will heal
 - full-thickness burns won't
- Partial thickness burns
 - sometimes only time will tell
 - basic principal of modern burn care:
GRAFT IF WON'T HEAL IN 14-21 DAYS

Fluids Resuscitation

- Parkland Formula for calculation of fluid replacement required for burns patient

**TOTAL BODY SURFACE AREA BURNT x 3 ml x WEIGHT OF
PATIENT IN KG**

Give 1st half of calculated fluid over 8 hours from time of burn

Give remainder over the next 16 hours

Preparation for Transfer to RBU

- Respiratory System
 - 100% humidified O₂
 - consider intubation if long transfer & concerns about inhalational injury
- Circulatory System
 - iv lines, fluid resus
 - watch peripheral circulation
 - May need escharotomies if circumferential limb or torso burns (especially if full thickness)

Escharotomies - To Do or Not To Do?

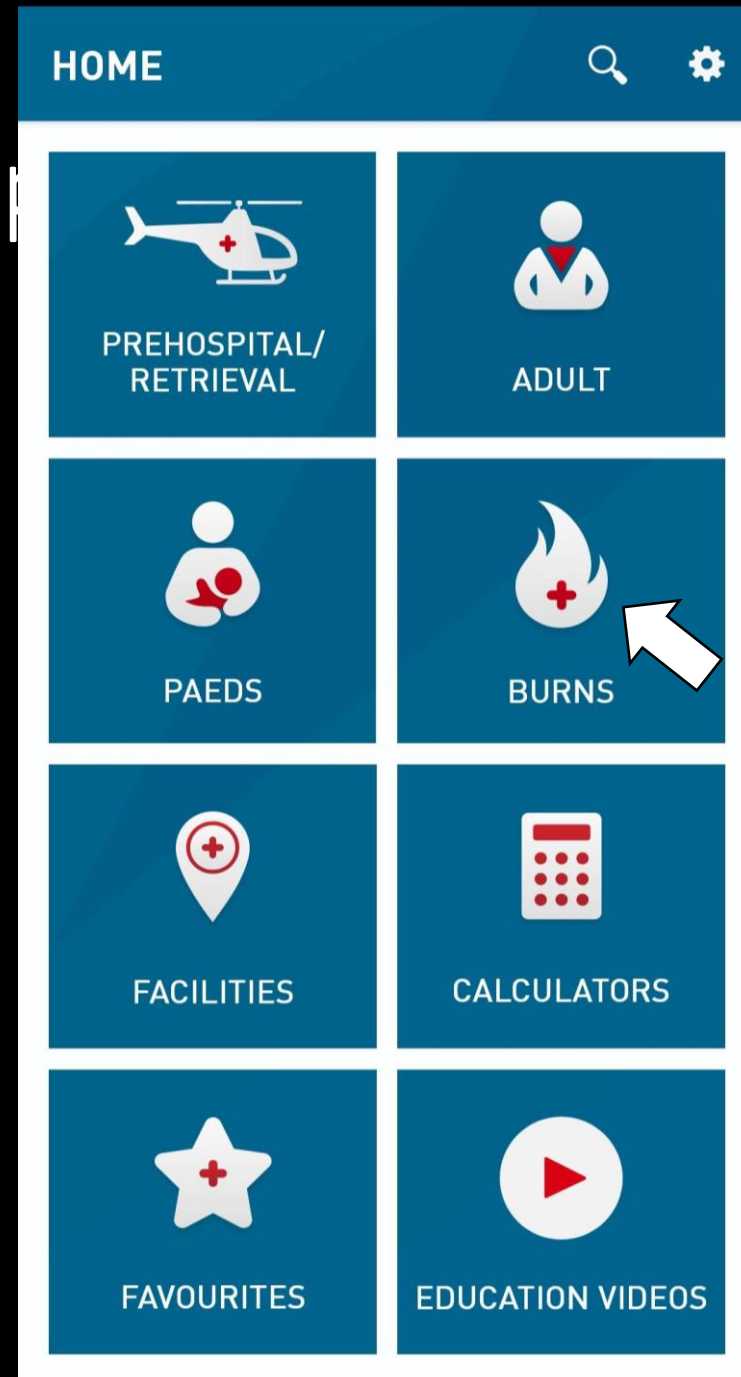

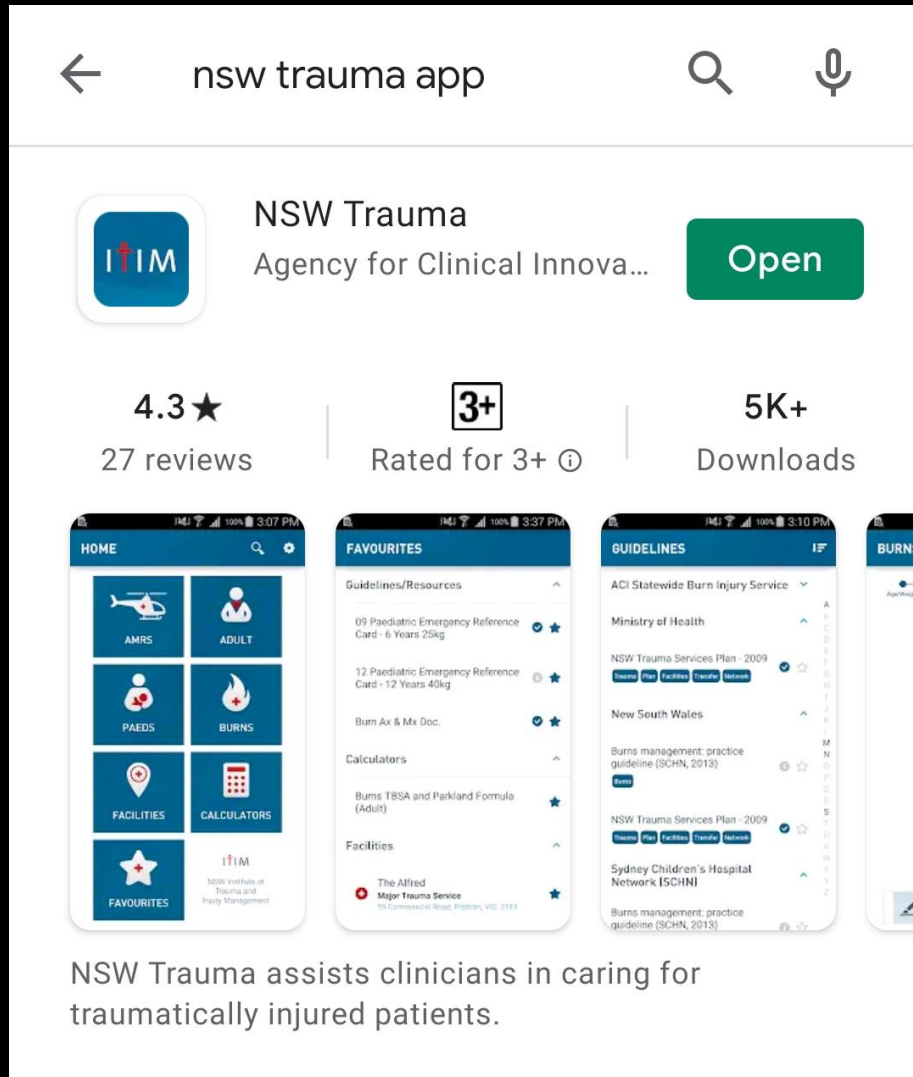

- To release rigid and inelastic burnt skin (eschar) to allow:
 - Circulation (in a limb)
 - Breathing (when chest involved)
- Usually in FT Circumferential burns
- Should not be performed before discussion with your RBU
- An operative procedure – to be performed urgently (but not immediately) in theatre

Preparation for Transfer

- Burn wound
 - keep covered *without* tight circumferential dressings
 - dry & warm dressing
 - Often use Gladwrap or similar if no better dressings available
- Pain relief

Recommend NST Trauma App

R		RECOMMENDATION	
FLUIDS	For burn injuries in Adults > 20% TBSA burn & Children > 10% TBSA estimate fluid resuscitation requirements from time of injury Use the Parkland formula to estimate fluid requirements for the first 24 hours, then adjust based on clinical response and urine output 3ml/kg/%burn, half over the first 8 hrs, remainder over next 16 hrs from time of burn not admission		Paediatric Maintenance Form 5% Dextrose & 0.9% saline Paediatric maintenance fluid is in addition to resuscitation fluid and remains constant
Resuscitation – Parkland (1 st 24 hours) Warmed Plasmalyte / Hartmann's		Up to 10kg... 4ml/kg/hr = ____ + from 10–20kg... 2ml/kg/hr = ____	
3 ml x ____ kg x ____ % TBSA = ____ ml 24 hour volume			
____ ml ÷ 2 = ____ ml 24 hour volume

POST ESCHAROTOMY CARE

- Continue MONITORING
 - circulation (in a limb)
 - breathing and ventilatory pressure (when chest involved)
- Elevate Limbs
- Continue Burn Care

Please contact your local Regional Burn Unit for further advice!

Summary

Call the NBS for advice anytime!!!

- Stop the burn, cool for 20 minutes
- EMST ABCD
- Beware inhalational injury
- Escharotomies are indicated to maintain or restore perfusion
 - On discussion with RBU
- Fluid as per Parklands formula
